

ULTRACET Tablet: Indicated for the Short-Term (Five Days or Less) Management of Acute Pain

Although, your health condition may impact your everyday life, do not let it define who you are. ULTRACET, a tramadol and acetaminophen combination, is used to relieve pain. Tramadol and acetaminophen combination provides better pain relief than either medicine used alone. In some cases, you may get relief with lower doses of each medicine. Tramadol belongs to the group of medicines called opioid analgesics (narcotics). It acts in the central nervous system (CNS) to relieve pain. When tramadol is used for a long time, it may become habit-forming (causing mental or physical dependence). Physical dependence may lead to side effects when you stop taking the medicine. Since this medicine is only used for the short-term relief of pain, physical dependence will probably not occur. Acetaminophen is used to relieve pain and reduce fever in patients. It does not become habit-forming when taken for a long time. But acetaminophen may cause other unwanted effects when taken in large doses, including liver damage. Although rare, use of acetaminophen has been reported to lead to liver transplantation and death, usually at high doses and when multiple acetaminophen-containing products have been used. This medicine is available only with your doctors prescription. Thanks and may you have a good understanding about this drug ULTRACET. You may want to share this book with your family and friends who may be in need of help and would want to use this medicine. Take care, and as always, be well!
